

# ProShow Gold – Transparent Layering

## How to Produce a Three- Layer Slide

### Layer 1

Add your first (background) .jpg slide.

### Layer 2

Select LAYER/ADD LAYER then add your image file.

NOTE This file type must support transparency i.e. .psd / .png / .tiff or .gif

You cannot use .jpg files.

### Layer 3

Select LAYER/ADD LAYER then add your image file.

NOTE This file type must support transparency i.e. .psd / .png / .tiff or .gif

You cannot use .jpg files.

The way you arrange the order of your slides determines which element appears to be closer to the viewer. In the example above Layer 2 will appear on top of Layer 3 however it is possible on the next slide to reverse the layer priorities. This makes it possible for an object to pass behind another object and then pass back in front of it again.
